BENEFITS OF ADDING AGRI-SC® TO STARTER FERTILIZER MIXES

Agri-SC® sharply reduces tension in the soil, and also reduces tension within the mix, permitting superior homogenization of the ingredients being mixed.

- a) **Agri-SC®** encourages seed to soil contact.
- b) **Agri-SC®** allows the soil to warm more quickly, by having excess water move through the soil rapidly, providing a warmer root zone for good seed germination.
- c) **Agri-SC®** breaks down bound water in the soil, permitting bonding of the nutrients in the area of the root zone.
- d) **Agri-SC®** breaks down tension in the root zone, and therefore when added to liquid fertilizers, a more even distribution of nutrients to the roots take place. The plant roots do not have to struggle to reach the nutrients.

METHODS OF SECURING THE BENEFITS OF AGRI-SC®

Concept: **Agri-SC®** may be injected into the fertilizer basically at any time, and under normal conditions will remain suspended in the solution mix.

- 1) Add 2 ounces of defoaming agent to the **Agri-SC®**.
- 2) Mix the **Agri-SC®** (with defoaming agent) with equal parts of water. This solution will help distribute **Agri-SC®** in the fertilizer solution, allowing for easier mixing.
- 3) As an example of the above: Liquid Fertilizer for 10 acres; use a 2-ounce **Agri-SC®** rate – use 20 ounces **Agri-SC®** and 20 ounces of water, then add to fertilizer mix. This should mix with little to virtually no agitation.
